

The July-8 roadmap, closed — and the plan for the next big upgrade

In the last update I laid out **three committed targets**. All three are now live in production: a respondent's personalized recommendations now reach the **results email**; the templates list no longer has a confusing duplicate link; and the three admin pages that used to say "**coming soon**" — Organizations, Campaigns, and Public Quizzes — are now **real, working pages**.

With that roadmap closed, I also did the homework on the next big thing: **an overhaul of the assessment builder itself**. I researched how the best assessment tools on the market design their editors and produced a costed, de-risked plan. That part is **designed, not yet built** — this update is honest about which is which.

3 / 3

committed roadmap targets from the last update — all shipped

3

"coming soon" admin pages now real — by reuse, not rebuild

1

researched, phased plan for the assessment-builder overhaul

1 • Recommendations now reach the results email

The capability I previewed for you last time is now switched on. When a respondent finishes an assessment, their results email can now carry the tailored recommendations — not just the scores.

Results email • both the respondent and the referring coach • scored and qualitative reports

- **The recommendations travel with the email**

The findings that appear on-screen now also render inside the results email, so the value lands even if no one opens the full report.

- **Safe by design — nothing fabricated goes out**

It only ever includes recommendations you have actually authored on a template. An assessment with no authored recommendations sends the **exact same email as before** — so there are no invented numbers reaching anyone.

2 · The three "coming soon" admin pages are now real

Three entries in the admin sidebar used to be placeholders. They're now working oversight pages — and they were built by **reusing** screens that already existed, not by rebuilding from scratch.

ASSESSMENTS → CAMPAIGNS

Every campaign, every company, one view

Admins can now see all invited campaigns across all companies at once — grouped by company, filterable by status, and including imported historical rounds. Previously this only existed per-coach in the portal.

ASSESSMENTS → ORGANIZATIONS

A directory of every company on the platform

Admins can browse any company and manage its members and teams from one place — the same roster tool coaches use, opened up for oversight.

The third, **Public Quizzes**, was an already-built page hidden behind a dead placeholder link — I simply wired it up and relabeled it. All three shipped with 60 automated tests and a clean adversarial review.

3 • A confusing duplicate link, removed

On the templates list, each row had both a "View" and an "Edit" link that went to the same place — you flagged this. Since there's no separate read-only view, the honest fix was to drop the redundant one.

ASSESSMENTS → TEMPLATES

Name opens the editor; "Edit" is the verb

The template name now opens the editor, and "Edit" stays as the clear action. Access, Disable, and Delete are untouched. Small thing — but it's the kind of rough edge worth clearing.

WHERE THAT LEAVES US

Every committed target from the last update is shipped and live.

The assessment tool is feature-complete for what we set out to build. The next arc is about making it dramatically easier to *author* — which is where the plan below comes in.

4 • Next: overhauling the assessment builder

The builder works, but editing one question means jumping between four separate tabs, there's no way to test an assessment before publishing it, and you only find out something's wrong *after* you hit publish. I researched how the leading assessment platforms solve this and turned it into a plan.

Researched against Qualtrics, Culture Amp, Typeform, ScoreApp and others · a phased, low-risk plan

- **What the research said**

The best tools let you edit a question in one place and validate it by **running** it — not by imagining it across tabs. On the things that make our tool special (versioning, comparability across rounds), we're actually **ahead** of the field; we just hide it.

- **The plan, sequenced for value-first, low risk**

- 1 Test before you publish**

Fill in sample answers and instantly see the scores, tiers, and recommendations a respondent would get — writing nothing. The single highest-value addition.

- 2 "Safe to publish" checklist**

Surface any problems *before* you publish, as a live checklist, instead of an error after the fact.

- 3 One-screen editor**

Then, only if it earns its keep, bring everything about a question onto one screen — done last, and reversible.

WHY THIS ORDER

An independent engineering review recommended shipping the two high-value capabilities first — they help regardless of layout — and treating the bigger visual rebuild as the last, **optional** step. That's a deliberately conservative sequence: value early, risk late.

What's next

The roadmap is clear; a couple of items are waiting on a decision from you.

I build "test before you publish" (step 1 above)

The first, highest-value slice of the builder overhaul — on your go.

Your call: SU-Full industry benchmarking

Universal benchmark vs. report-specific — a direction decision only you can make.

Your call: a few wording items

The QSP invite copy and the three clarifications from your earlier feedback (#15 / #16 / #19).
